Models of Communication

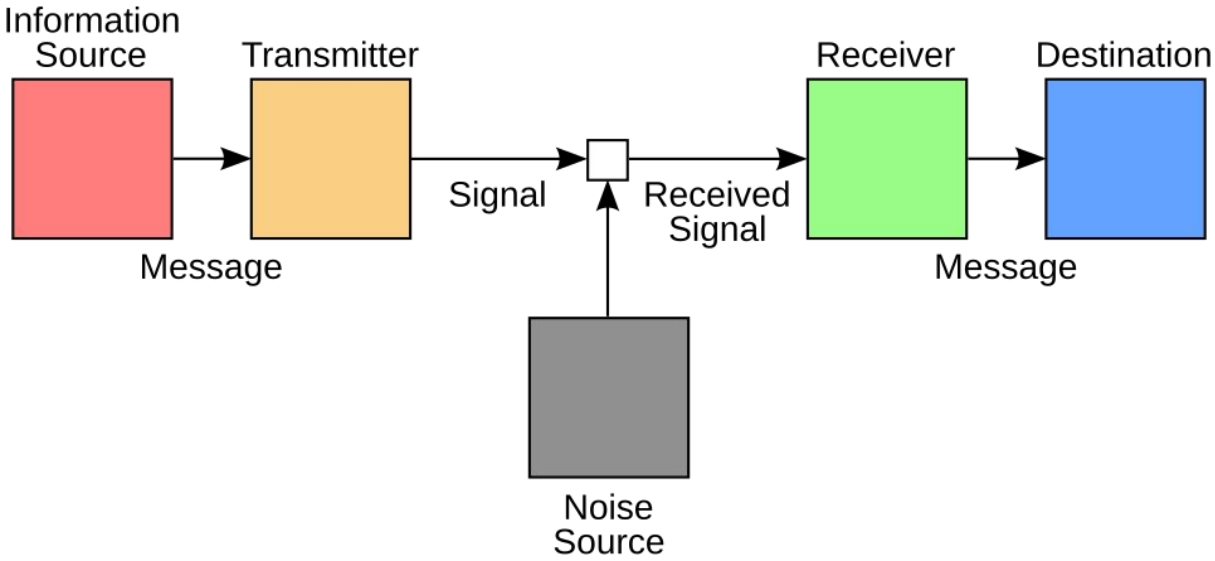

- aim to facilitate effective interaction and the transfer of information between senders and receiver

Types of Communication Models

- Linear
- Interactive
- Transactional

Linear Model (Shannon-Weaver model)

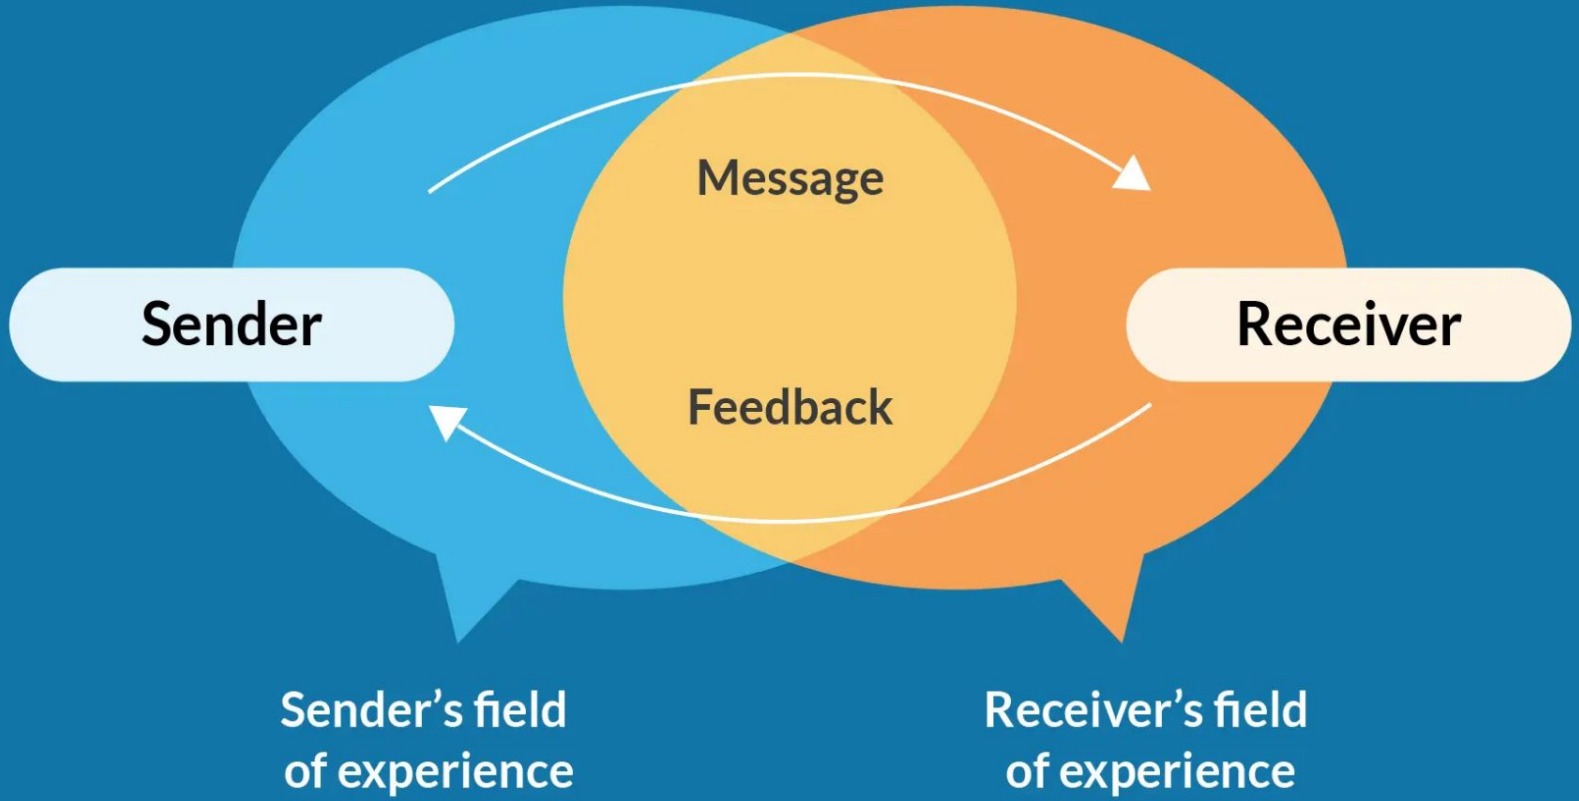

- One of the first models of communication
- it explains communication in terms of five basic components: a source, a transmitter, a channel, a receiver, and a destination
- has faced criticism for overlooking the dynamic nature of human interactions and feedback

Information Source
Transmitter
Receiver
Destination
Signal
Received Signal
Message
Message
Noise Source

Interactive Model

- acknowledges the importance of a shared context and reciprocal communication
- Attributed to Schramm, this model of communication involves a delivery of messages that consists of continuing interaction between the communicators, which includes a shared field of experiences
- Schramm introduced the notions of social context and feedback
- every message is part of a continuing interaction between two communicators (the initiator and the receiver), each of whom then takes turns serving as the sender or receiver
- proposed that information transmission involved three key areas
    - syntactic
    - pragmatic
    - semantic

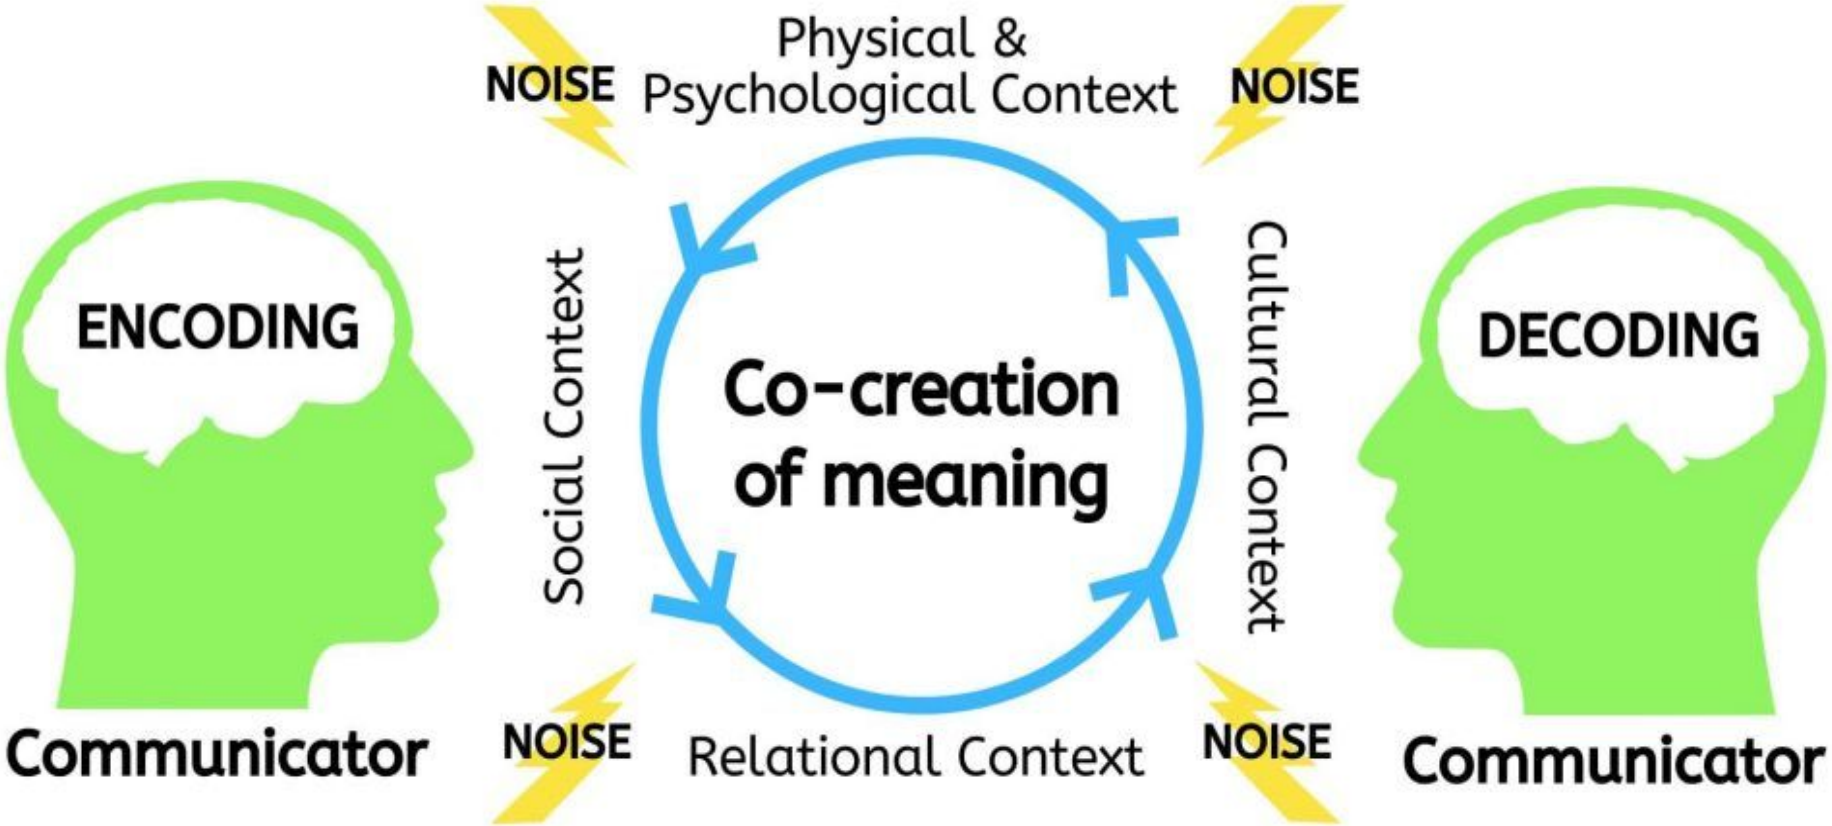

Interactive Model of Communication

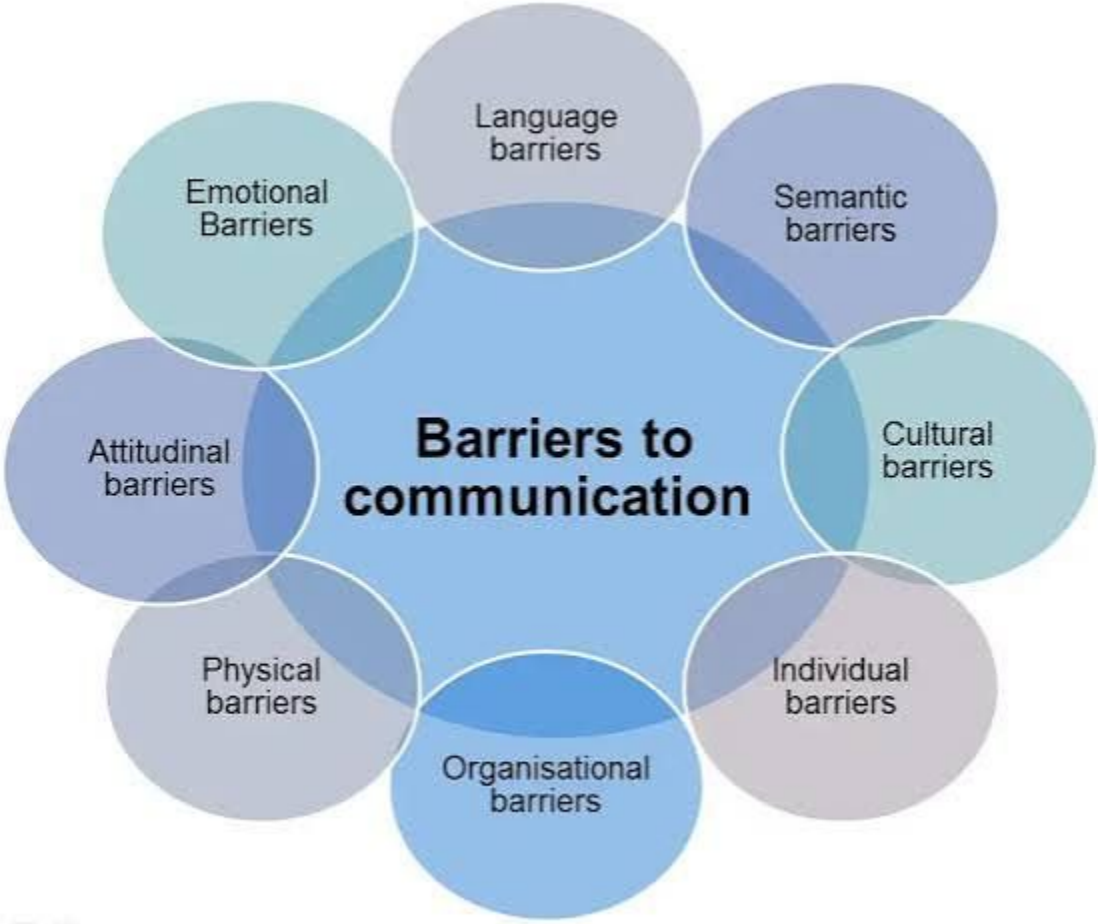

Transactional Model

- Barnlund introduced the *transactional* model
- according to Bowman and Targowski (1987), acknowledged a “total personality” in the communication process
- the importance of self-communication as it “influences meanings and actions”

The Transaction Model of Communication

Barriers to communication
Language barriers
Semantic barriers
Cultural barriers
Individual barriers
Organisational barriers
Physical barriers
Attitudinal barriers
Emotional Barriers
